NORTH SYDNEY GIRLS HIGH SCHOOL

Mathematics Extension 2 2013 Trial HSC Examination

General Instructions

- Reading time 5 minutes
- Working time 3 hours
- Write using black or blue pen. Black pen is preferred
- Board approved calculators may be used
- A table of standard integrals is provided at the back of this paper
- In Questions 11-16, show relevant mathematical reasoning and/or calculations

Total marks - 100

Section 1 – Pages 2 – 5 **10 marks**

- Attempt Questions 1-10
- Allow about 15 minutes for this section

Section II – Pages 6-14 **90 marks**

- Attempt Questions 11 16
- Allow about 2 hours and 45 minutes for this section

Attempt Questions 1-10

Allow about 15 minutes for this section

Use the multiple-choice answer sheet for Questions 1-10.

- 1 Let z = a + ib where a and b are real and non-zero. Which of the following is not true?
 - (A) $z + \overline{z}$ is real
 - (B) $\frac{z}{\overline{z}}$ is non-real
 - (C) $z^2 (\overline{z})^2$ is real
 - (D) $z\overline{z}$ is real and positive
- Which of the following corresponds to the set of points in the complex plane defined by |z + 2i| = |z|?
 - (A) the point given by z = -i
 - (B) the line Im(z) = -1
 - (C) the circle with centre -2i and radius 1
 - (D) the line Re(z) = -1
- 3 The equation $9x^3 27x^2 + 11x 7 = 0$ has roots α , β and γ .

What is the value of $\frac{1}{\beta \gamma} + \frac{1}{\alpha \gamma} + \frac{1}{\alpha \beta}$?

- (A) $\frac{27}{7}$
- (B) $-\frac{27}{7}$
- (C) $-\frac{11}{7}$
- (D) $\frac{11}{7}$
- The polynomial equation P(x) = 0 has real coefficients, and has roots which include x = -2 + i and x = 2. What is the minimum possible degree of P(x)?
 - (A) 1
- (B) 2
- (C) 3
- (D) 4

5 Using a suitable substitution, what is the correct expression for $\int_{0}^{\frac{\pi}{3}} \sin^{3} x \cos^{4} x dx$

in terms of u?

(A)
$$\int_{0}^{\frac{\sqrt{3}}{2}} \left(u^{4} - u^{6}\right) du$$
 (B)
$$\int_{1}^{\frac{1}{2}} \left(u^{6} - u^{4}\right) du$$

(C)
$$\int_{\frac{1}{2}}^{1} (u^6 - u^4) du$$
 (D)
$$\int_{0}^{\frac{\sqrt{3}}{2}} (u^6 - u^4) du$$

There are 5 pairs of socks in a drawer. Four socks are randomly chosen from the drawer. Which expression represents the probability that all four of the socks come from different pairs?

$$(A) \qquad 1 \times \frac{1}{9} \times \frac{1}{8} \times \frac{1}{7}$$

(B)
$$1 \times \frac{9}{10} \times \frac{8}{9} \times \frac{7}{8}$$

(C)
$$1 \times \frac{8}{9} \times \frac{6}{7} \times \frac{4}{5}$$

(D)
$$1 \times \frac{8}{9} \times \frac{6}{8} \times \frac{4}{7}$$

7 The equation $x^3 + y^3 = 3xy$ is differentiated implicitly with respect to x. Which of the following expressions is $\frac{dy}{dx}$?

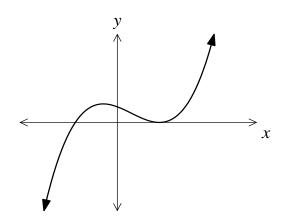

$$(A) \qquad \frac{y - x^2}{v^2 - x}$$

$$(B) \qquad \frac{y^2 - x}{y - x^2}$$

$$(C) \qquad \frac{x^2 + y^2}{x}$$

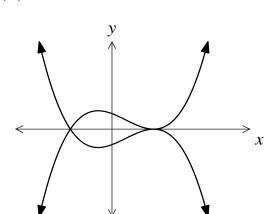

$$(D) \qquad \frac{x^2}{x - y^2}$$

8 The graph y = f(x) is shown.

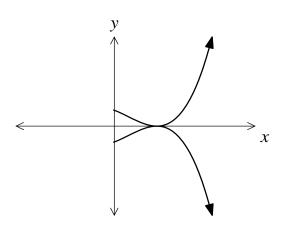

Which of the following graphs best represents $y^2 = f(x)$?

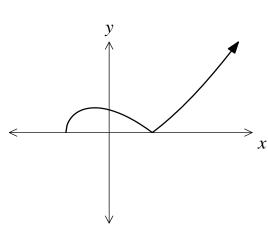

(A)

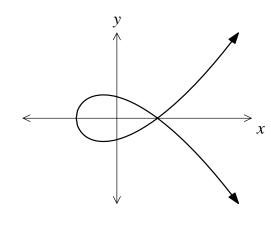

(B)

(C)

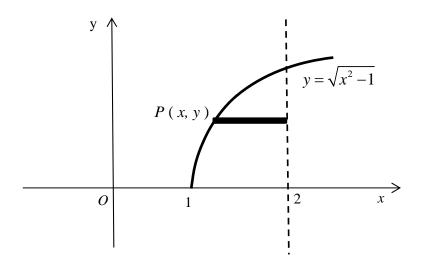

(D)

- A body is moving in a straight line and, after t seconds, it is x metres from the origin and travelling at v ms⁻¹. Given that v = x and that t = 3 where x = -1, what is the equation for x in terms of t?
 - $(A) x = e^{t-3}$
 - (B) $x = -e^{t-3}$
 - $(C) x = \sqrt{2t 5}$
 - (D) $x = -\sqrt{2t 5}$

10

The region bounded by the x axis, the curve $y = \sqrt{x^2 - 1}$ and the line x = 2 is rotated around the y axis.

The slice at P(x, y) on the curve is perpendicular to the axis of rotation. What is the volume δV of the annular slice formed?

- (A) $\pi (3-y^2)\delta y$
- (B) $\pi \left(4 \left(y^2 + 1\right)^2\right) \delta y$
- (C) $\pi (4-x^2)\delta x$
- (D) $\pi (2-x)^2 \delta x$

Section II

90 marks

Attempt Questions 11-16

Allow about 2 hours and 45 minutes for this section

In Questions 11-16, your responses should include relevant mathematical reasoning and/or calculations.

Question 11 (15 marks) Use a SEPARATE writing booklet.

(a) Let z = -5 - 12i and $\omega = 2 - i$. Find in the form x + iy

(i)
$$(1+i)\overline{\omega}$$

(ii)
$$\frac{z}{2-3i}$$

(b) By first writing $w = -\sqrt{3} + i$ in modulus argument form, show that $w^3 - 8i = 0$.

(c) By completing the square, find
$$\int \frac{1}{\sqrt{3-2x-x^2}} dx$$
.

(d) Use the substitution
$$u = x^2 + 1$$
 to evaluate
$$\int_0^{\sqrt{3}} \frac{x^3}{\sqrt{x^2 + 1}} dx.$$
 3

(e) (i) Without using calculus, sketch the curve
$$y = \frac{x+2}{(x-1)(x+3)}$$
 showing all important features.

(ii) Find the area bounded by the curve and the x-axis between x = 2 and x = 5.

Question 12 (15 marks) Use a SEPARATE writing booklet.

- a) Consider the complex number z = x + iy where $z^2 = a + ib$.
 - (i) Sketch on the same set of axes, the graphs of $x^2 y^2 = a$ and 2xy = b where both a and b are positive.

 The foci and directrices of the curves need NOT be found.
 - (ii) Use the graphs to explain why there are two distinct square roots of the complex number a+ib if a>0 and b>0.
 - (iii) Consider how the sketch changes when b is negative. What is the relationship between the new square roots and those found when b was positive?
- (b) The region enclosed by the curves $y = \frac{4}{x^2 + 4}$ and $y = \frac{1}{x^2 + 1}$ and the ordinates x = 0 and x = 2 is rotated about the y axis. Using the method of cylindrical shells, find the volume of the solid formed.
- (c) A particle's acceleration is given by $\ddot{x} = 3(1-x)(1+x)$ where x is the displacement in metres. Initially the particle is at the origin with velocity 2 metres per second.
 - (i) Show that $v^2 = 2(2-x)(x+1)^2$.
 - (ii) Find the velocity and acceleration at x = 2.
 - (iii) Describe the motion of the particle.
 - (iv) Find the maximum speed and where it occurs.

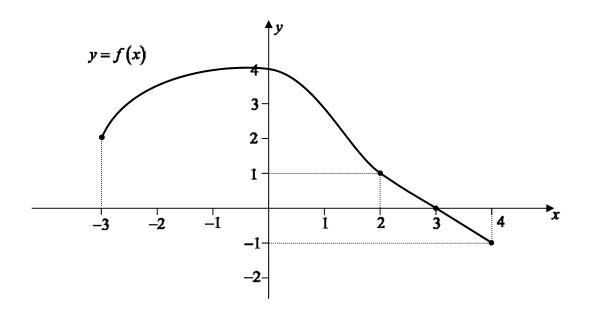

Question 13 (15 marks) Use a SEPARATE writing booklet.

- (a) (i) Show that $x^2 + y^2 \ge xy$ where x and y are real numbers.
 - (ii) If x + y = 3z show that $x^2 + y^2 \ge 3z^2$.
- (b) The complex numbers z and w each have a modulus of 2. The arguments of z and w are $\frac{4\pi}{9}$ and $\frac{7\pi}{9}$ respectively.
 - (i) Sketch vectors representing z, w and z + w on the Argand diagram, showing any geometrical relationships between the three vectors.
 - (ii) Find arg(z+w).
 - (iii) Evaluate |z+w|.
- (c) Use the substitution $t = \tan \frac{x}{2}$ to show that $\int_0^{\frac{\pi}{2}} \frac{dx}{2 + \sin x} = \frac{\pi}{3\sqrt{3}}.$
 - (ii) Show that $\int_0^{2a} f(x) dx = \int_0^a [f(x) + f(2a x)] dx$.
 - (iii) Hence, or otherwise, evaluate $\int_0^{\pi} \frac{x}{2 + \sin x} dx$.

Blank Page

Question 14 (15 marks) Use a SEPARATE writing booklet.

(a) The diagram shows the graph of y = f(x) which is only defined over the domain $-3 \le x \le 4$.

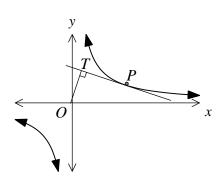

Draw separate one-third page sketches of the graphs of the following:

$$y = f(|x|)$$

(ii)
$$y = \ln(f(x))$$

(b)

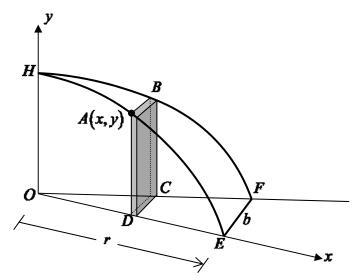

The point $P\left(ct, \frac{c}{t}\right)$ lies on the hyperbola $xy = c^2$. The point T lies at the foot of the perpendicular drawn from the origin O to the tangent at P.

- (i) Show that the tangent at P has equation $x + t^2y = 2ct$.
- (ii) If the coordinates of T are (x_1, y_1) show that $y_1 = t^2 x_1$.
- (iii) Show that the locus of T is given by $(x^2 + y^2)^2 = 4c^2xy$.

Question 14 continues on page 11

Question 14 (continued)

(c)

The horizontal base of a solid is an isosceles triangle OEF where OE = OF = r and EF = b. HAE is the parabolic arc with equation $y = r^2 - x^2$ where E lies on the x-axis. HBF is another parabolic arc, congruent to HAE, so that the plane OHBF is vertical. A rectangular slice ABCD of width δx is taken perpendicular to the base, such that CD lies in the base and $CD \parallel EF$.

(i) Show that the volume of the slice *ABCD* is
$$\frac{bx}{r}(r^2 - x^2)\delta x$$
.

(ii) Hence show that the solid *HOEF* has volume
$$\frac{br^3}{4}$$
.

(iii) Suppose now that
$$\angle EOF = \frac{2\pi}{n}$$
 and that n identical solids $HOEF$ are arranged about O as centre with common vertical axis OH to form a solid S . Show that the volume V_n of S is given by $V_n = \frac{1}{2} r^4 n \sin \frac{\pi}{n}$.

(iv) When *n* is large, the solid *S* approximates the volume of the solid of revolution formed by rotating the region bound by the *x* axis and the curve $y = r^2 - x^2$ about the *y* axis.

Using the fact that $\frac{\sin x}{x} \to 1$ as $x \to 0$ find $\lim_{n \to \infty} V_n$.

End of Question 14

Question 15 (15 marks) Use a SEPARATE writing booklet.

(a) The equation $2x^3 - 5x + 1 = 0$ has roots α , β , γ . Find the equation whose roots are -2α , -2β , and -2γ .

(b) (i) For
$$z = \cos \theta + i \sin \theta$$
, show that $z^n + z^{-n} = 2 \cos n\theta$.

(ii) If
$$z + \frac{1}{z} = u$$
, find an expression for $z^3 + \frac{1}{z^3}$ in terms of u .

(iii) It can be shown that
$$z^5 + \frac{1}{z^5} = u^5 - 5u^3 + 5u$$
. (Do not prove this). 3
Show that

$$1 + \cos 10\theta = 2\left(16\cos^5\theta - 20\cos^3\theta + 5\cos\theta\right)^2$$

(c) *Q P R*

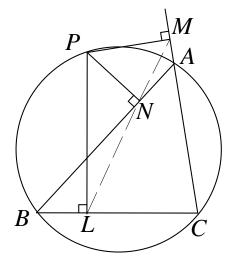

In the Argand diagram, the points P, Q and R represent the complex numbers p, q and r.

(i) Given that the triangle *PQR* is equilateral, explain why $r - q = \operatorname{cis} \frac{2\pi}{3} (q - p)$

(ii) Hence, or otherwise show $2r = (p+q) + i\sqrt{3}(q-p)$

Question 15 continues on page 13

(d)

In the diagram, P is any point on the circle ABC. The point N lies on AB such that PN is perpendicular to AB. Similarly, points M and L lie at the foot of the perpendiculars drawn from P to CA (produced) and BC respectively.

- (i) State why *BLNP* is a cyclic quadrilateral.
- (ii) Prove that the points *L*, *M* and *N* are collinear.

End of Question 15

Question 16 (15 marks) Use a SEPARATE writing booklet.

- (a) Let $P(a\cos\theta, b\sin\theta)$ be a point on the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$. The focus of the ellipse Is S(ae, 0) where e is the eccentricity and O is the origin.
 - (i) Find the coordinates of the centre *C* and the radius of the circle of which *SP* is a diameter.
 - (ii) Show that $OC = \frac{a}{2} (e \cos \theta + 1)$
- (b) Show that the polynomial $P(x) = 4x^3 + 10x^2 + 8x + 3$ is divisible by (2x+3).
 - (ii) Hence express the polynomial in the form P(x) = A(x)Q(x) where Q(x) is a real quadratic polynomial.
- (c) Using the fact that $\tan^{-1} x + \tan^{-1} y = \tan^{-1} \frac{x+y}{1-xy}$ for $0 \le x < 1$ and $0 \le y < 1$ prove by mathematical induction that for all positive integers n,

$$\tan^{-1}\frac{1}{2\times 1^{2}} + \tan^{-1}\frac{1}{2\times 2^{2}} + \tan^{-1}\frac{1}{2\times 3^{2}} + \dots + \tan^{-1}\frac{1}{2\times n^{2}} = \frac{\pi}{4} - \tan^{-1}\frac{1}{2n+1}$$

Question 16 continues on page 15

Question 16 (continued)

- (d) Consider $f(x) = \log x x + 1$.
 - (i) Show that $f(x) \le 0$ for all x > 0.
 - (ii) Consider the set of n positive numbers p_1 , p_2 , p_3 ,... p_n such that $p_1 + p_2 + p_3 + \dots + p_n = 1.$

By using the result in part (i), deduce that

$$\sum_{r=1}^{n} \log (np_r) \le np_1 + np_2 + np_3 \dots + np_n - n$$

- (iii) Show that $\sum_{r=1}^{n} \log np_r \le 0$.
- (iv) Hence deduce that $0 < n^n p_1 p_2 p_3 \dots p_n \le 1$

End of paper

STANDARD INTEGRALS

$$\int x^{n} dx = \frac{1}{n+1} x^{n+1}, \quad n \neq -1; \quad x \neq 0, \text{ if } n < 0$$

$$\int \frac{1}{x} dx = \ln x, \quad x > 0$$

$$\int e^{ax} dx = \frac{1}{a} e^{ax}, \quad a \neq 0$$

$$\int \cos ax dx = \frac{1}{a} \sin ax, \quad a \neq 0$$

$$\int \sin ax dx = -\frac{1}{a} \cos ax, \quad a \neq 0$$

$$\int \sec^{2} ax dx = \frac{1}{a} \tan ax, \quad a \neq 0$$

$$\int \sec ax \tan ax dx = \frac{1}{a} \tan^{-1} \frac{x}{a}, \quad a \neq 0$$

$$\int \frac{1}{a^{2} + x^{2}} dx = \sin^{-1} \frac{x}{a}, \quad a \neq 0$$

$$\int \frac{1}{\sqrt{a^{2} - x^{2}}} dx = \sin^{-1} \frac{x}{a}, \quad a > 0, \quad -a < x < a$$

$$\int \frac{1}{\sqrt{x^{2} - a^{2}}} dx = \ln\left(x + \sqrt{x^{2} - a^{2}}\right), \quad x > a > 0$$

$$\int \frac{1}{\sqrt{x^{2} + a^{2}}} dx = \ln\left(x + \sqrt{x^{2} + a^{2}}\right)$$

2013 Extension 2 Trial HSC Solutions

1. (A)
$$z + \overline{z} = (a + ib) + (a - ib)$$

= $2a$ (which is real)

(But you should know that $z + \overline{z} = 2 \operatorname{Re} z$)

(B)
$$\frac{z}{\overline{z}} = \frac{a+ib}{a-ib} \times \frac{a+ib}{a+ib}$$
$$= \frac{a^2 - b^2}{a^2 + b^2} + \frac{2ab}{a^2 + b^2}i \quad \text{(which is not real since } a, b \neq 0\text{)}$$

Alternatively

$$\frac{z}{\overline{z}} = \frac{r \operatorname{cis} \theta}{r \operatorname{cis} (-\theta)}$$
$$= \operatorname{cis} 2\theta$$

which is real if $2\theta = k\pi$ (where k is an integer)

$$\theta = \frac{k}{2}\pi$$
 (ie. z is either real or pure imaginary)

But this is not the case, since neither a nor b is zero

(C)
$$z^{2} - (\overline{z})^{2} = (a+ib)^{2} - (a-ib)^{2}$$
$$= a^{2} + 2abi - b^{2} - a^{2} + 2abi + b^{2}$$
$$= 4abi \qquad \text{(which is never real since } a, b \neq 0\text{)}$$

(D)
$$z\overline{z} = |z|^2$$
 which by definition of modulus is real and positive (C)

2. Without doing any algebra, this is the set of point which are equidistant from (0,-2) and (0,0). ie. y = -1 (B)

3.
$$\frac{1}{\beta \gamma} + \frac{1}{\alpha \gamma} + \frac{1}{\alpha \beta} = \frac{\alpha + \beta + \gamma}{\alpha \beta \gamma}$$

$$= \frac{\frac{27}{9}}{\frac{7}{9}}$$

$$= \frac{27}{-\frac{7}{9}}$$

4. Since P(x) = 0 has real coefficients, the conjugate of the root x = -2 + i must also be a root. (C) So the polynomial must have at least 3 roots (and there is not enough information to conclude more.)

5.
$$\int_{0}^{\frac{\pi}{3}} \sin^{3} x \cos^{4} x \, dx = \int_{0}^{\frac{\pi}{3}} \cos^{4} x \left(1 - \cos^{2} x\right) \cdot \sin x \, dx \qquad \text{Let } u = \cos x \qquad x = 0, \ u = 1 \qquad \text{(B)}$$
$$= \int_{1}^{\frac{1}{2}} u^{4} \left(1 - u^{2}\right) \cdot \left(-du\right)$$
$$= \int_{1}^{\frac{1}{2}} \left(u^{6} - u^{4}\right) du$$

7.
$$x^{3} + y^{3} = 3xy$$

$$2x^{2} + 2y^{2} \cdot \frac{dy}{dx} = 2x \cdot \frac{dy}{dx} + y \cdot 2 \quad \text{(product rule)}$$

$$(y^{2} - x)\frac{dy}{dx} = y - x^{2}$$

$$\frac{dy}{dx} = \frac{y - x^{2}}{y^{2} - x}$$

Alternative setting out:

$$x^{3} + y^{3} = 3xy$$

$$\cancel{\beta}x^{2} \cdot dx + \cancel{\beta}y^{2} \cdot dy = \cancel{\beta}(x \cdot dy + y \cdot dx)$$

$$(y^{2} - x)dy = (y - x^{2})dx$$

$$\frac{dy}{dx} = \frac{y - x^{2}}{y^{2} - x}$$
(A)

8. Negative root (single root) must become a vertical point.

To the left of the negative root, f(x) is -ve, so can't be square rooted.

Positive root is a multiple root, so we can't determine the nature of the corresponding point on the new graph. (But we are only asked for the *best* answer.)

$$y^2 = f(x)$$
 becomes $y = \pm \sqrt{f(x)}$, hence symmetry in the x-axis. (D)

9. Easiest method – check the options by differentiating to get v. The only options whose derivatives are the function itself (ie. v = x) are (A) and (B). But (B) is the only option that also allows x to equal -1.

Alternative method:

$$\frac{dx}{dt} = x$$

$$\frac{dx}{x} = dt$$

$$\int \frac{dx}{x} = \int dt$$

$$\ln|x| = t + c$$

$$(t = 3, x = -1) \quad 0 = 3 + c$$

$$c = -3$$

$$\ln|x| = t - 3$$
$$|x| = e^{t-3}$$
$$x = \pm e^{t-3}$$

But for x to equal -1, we need the -ve case:

$$x = -e^{t-3} \tag{B}$$

10.
$$\delta V = \pi (R^2 - r^2) h$$
$$= \pi (2^2 - x^2) \delta y$$

But
$$y = \sqrt{x^2 - 1}$$

 $y^2 = x^2 - 1$
 $x^2 = y^2 + 1$

$$\therefore \delta V = \pi \left[4 - \left(y^2 + 1 \right) \right] \delta y$$

$$= \pi \left(3 - y^2 \right) \delta y$$
(A)

Question 11

(a) (i)
$$(1+i)\overline{\omega} = (1+i)(2+i)$$

= $2+i+2i-1$
= $1+3i$

(ii)
$$\frac{z}{2-3i} = \frac{-5-12i}{2-3i} \times \frac{2+3i}{2+3i}$$
$$= \frac{-10-15i-24i+36}{4+9}$$
$$= \frac{26-39i}{13}$$
$$= 2-3i$$

(b)
$$w = 2 \operatorname{cis} \frac{5\pi}{6}$$

 $w^3 - 8i = \left(2 \operatorname{cis} \frac{5\pi}{6}\right)^3 - 8i$
 $= 8 \operatorname{cis} \frac{5\pi}{2} - 8i$
 $= 8i - 8i$ (hopefully you don't need to write $\operatorname{cis} \frac{5\pi}{2}$ as $\operatorname{cos} \frac{5\pi}{2} + i \operatorname{sin} \frac{5\pi}{2}$ to see this)
 $= 0$

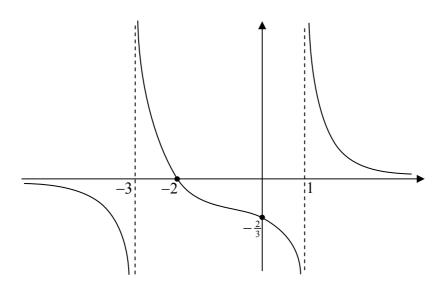

(c)
$$\int \frac{dx}{\sqrt{3-2x-x^2}} = \int \frac{dx}{\sqrt{-(x^2+2x+1)+3+1}}$$
$$= \int \frac{dx}{\sqrt{4-(x+1)^2}}$$
$$= \sin^{-1}\frac{x+1}{2} + c$$

(d)
$$\int_{0}^{\sqrt{3}} \frac{x^{3} dx}{\sqrt{x^{2} + 1}} = \frac{1}{2} \int_{0}^{\sqrt{3}} \frac{x^{2}}{\sqrt{x^{2} + 1}} \cdot 2x dx$$
$$= \frac{1}{2} \int_{1}^{4} \frac{u - 1}{\sqrt{u}} \cdot du$$
$$= \frac{1}{2} \int_{1}^{4} \left(u^{\frac{1}{2}} - u^{-\frac{1}{2}} \right) du$$
$$= \left[\frac{1}{3} u^{\frac{3}{2}} - u^{\frac{1}{2}} \right]_{1}^{4}$$
$$= \frac{8}{3} - 2 - \frac{1}{3} + 1$$
$$= \frac{4}{3}$$

Let
$$u = x^2 + 1$$

$$du = 2x dx$$

$$\begin{pmatrix} x = 0, & u = 1 \\ x = \sqrt{3}, & u = 4 \end{pmatrix}$$

(ii)
$$A = \int_{2}^{5} \frac{(x+2)dx}{(x-1)(x+3)}$$
Let $\frac{x+2}{(x-1)(x+3)} = \frac{A}{x-1} + \frac{B}{x+3}$

$$x+2 = A(x+3) + B(x-1)$$

$$(x=1) \quad 3 = 4A \quad \Rightarrow \quad A = \frac{3}{4}$$

$$(x=-3) \quad -1 = -4B \quad \Rightarrow \quad B = \frac{1}{4}$$

$$A = \frac{1}{4} \int_{2}^{5} \left(\frac{3}{x-1} + \frac{1}{x+3}\right) dx$$

$$= \frac{1}{4} \left[3\ln|x-1| + \ln|x+3|\right]_{2}^{5}$$

$$= \frac{1}{4} (3\ln 4 + \ln 8 - 0 - \ln 8)$$

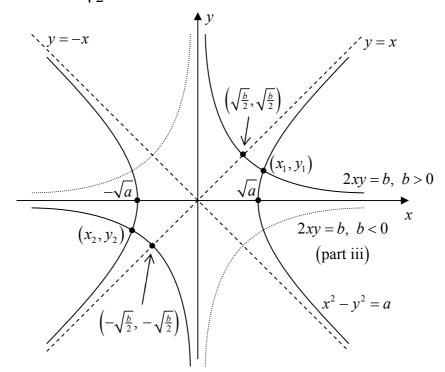

$$= \frac{1}{4} \ln \frac{4^{3} \times 8}{5}$$

$$= \frac{1}{4} \ln \frac{512}{5}$$

Question 12

When y = x, $2x^2 = b$ (a) (i)

$$x = \pm \sqrt{\frac{b}{2}}$$

(ii) Let
$$z = x + iy$$

$$z^{2} = a + ib$$
$$(x + iy)^{2} = a + ib$$

$$(x+iy)^2 = a+ib$$
$$(x^2-y^2)+2xyi = a+ib$$

Equating real and imaginary parts: $x^2 - y^2 = a$

$$2xy = b$$

Solving simultaneously for x and y, we get the graphs of part (i).

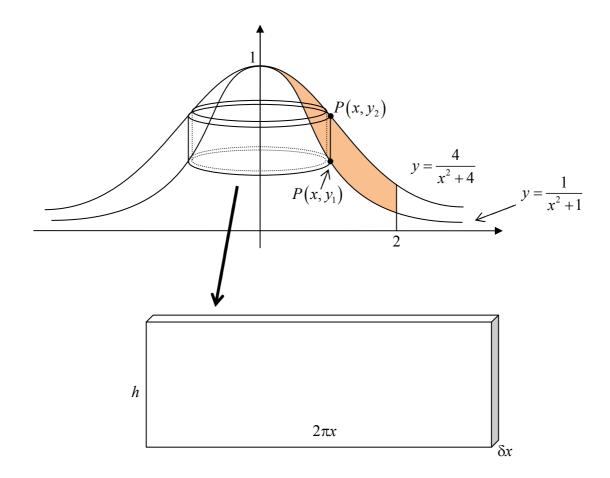

The graphs show that there are two distinct points of intersection (x_1, y_1) and (x_2, y_2)

corresponding to two distinct complex roots $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2$ of the complex number a+ib.

When b is negative, the graph of 2xy = b lies in the 2nd and 4th quadrants.

So the points of intersection with $x^2 - y^2 = a$ are $(x_1, -y_1)$ and $(x_2, -y_2)$.

ie. the new square roots are the conjugates of the roots found in part (ii).

$$h = y_2 - y_1$$

$$= \frac{4}{x^2 + 4} - \frac{1}{x^2 + 1}$$

Volume of shell $\delta V \approx 2\pi x h \cdot \delta x$

$$= 2\pi x \left(\frac{4}{x^2 + 4} - \frac{1}{x^2 + 1}\right) \delta x$$
Volume $V = \lim_{\delta x \to 0} \sum_{x=0}^{2} 2\pi x \left(\frac{4}{x^2 + 4} - \frac{1}{x^2 + 1}\right) \delta x$

$$= \pi \int_{0}^{2} \left(\frac{8x}{x^2 + 4} - \frac{2x}{x^2 + 1}\right) dx$$

$$= \pi \left[4\ln(x^2 + 4) - \ln(x^2 + 1)\right]_{0}^{2}$$

$$= \pi \left(4\ln 8 - \ln 5 - 4\ln 4 + 0\right)$$

$$= \pi \ln \frac{8^4}{5 \times 4^4}$$

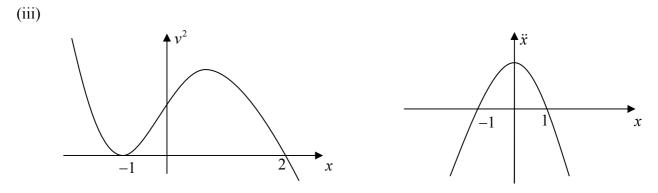

$$= \pi \ln \frac{16}{5} \text{ units}^3$$

(c) (i)
$$\ddot{x} = 3(1-x)(1+x)$$
$$\frac{d}{dx}(\frac{1}{2}v^2) = 3-3x^2$$
$$\frac{1}{2}v^2 = 3x - x^3 + c$$
$$(x = 0, v = 2) \quad 2 = c$$
$$\frac{1}{2}v^2 = 3x - x^3 + 2$$
$$v^2 = 6x - 2x^3 + 4$$

Check RHS:
$$2(2-x)(x+1)^{2} = (4-2x)(x^{2}+2x+1)$$
$$= 4x^{2}+8x+4-2x^{3}-4x^{2}-2x$$
$$= 6x-2x^{3}+4$$
$$= LHS$$

$$v^2 = 2(2-x)(x+1)^2$$

(ii)
$$x = 2$$
: $v = 0$
 $\ddot{x} = 3(1-2)(1+2)$
 $= -9 \text{ ms}^{-2}$

Firstly, the particle cannot ever be to the right of x = 2, as v^2 would be -ve.

Secondly, the particle can *possibly* change direction only when v = 0, ie. at x = -1 and x = 2.

Initially, the velocity is +2, so the particle moves to the right, speeding up until it reaches x = 1, then slowing to a stop at x = 2.

Since the acceleration at x = 2 is -ve, it then changes direction, speeds up until it again reaches x = 1, then slowing to a stop at x = -1.

At x = -1 the velocity and acceleration are both zero (and dependent only on position, not time), so the particle remains at x = -1.

(iv) From the graphs, the max speed (over the restricted domain $-1 \le x \le 2$) occurs at x = 1 ($\ddot{x} = 0$).

$$v_{\text{max}}^2 = 2(2-1)(1+1)^2$$

= 8
 $v_{\text{max}} = 2\sqrt{2} \text{ m/s}$

Question 13

(a) (i)
$$(x-y)^2 \ge 0 \quad \forall \text{ real } x, y$$

$$x^2 - 2xy + y^2 \ge 0$$

$$x^2 + y^2 \ge 2xy$$

If x, y have the same sign, xy > 0, so 2xy > xy, so $x^2 + y^2 \ge xy$. If x, y have opposite sign, xy < 0, so $x^2 + y^2 \ge xy$ as $x^2 + y^2 \ge 0$.

OR

$$x^{2} + y^{2} - xy = \left(x - \frac{y}{2}\right)^{2} + \frac{3}{4}y^{2}$$

$$\geq 0 \qquad \text{(sum of 2 perfect squares)}$$

$$x^{2} + y^{2} \geq xy$$

(ii)
$$x^2 + y^2 - 3z^2 = x^2 + y^2 - 3\left(\frac{x+y}{3}\right)^2$$

$$= x^2 + y^2 - \frac{x^2 + 2xy + y^2}{3}$$

$$= \frac{3x^2 + 3y^2 - x^2 - 2xy - y^2}{3}$$

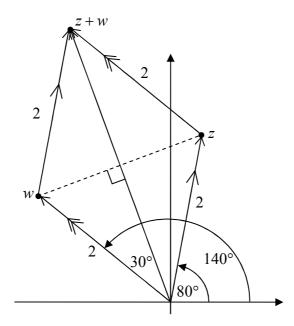

$$= \frac{2x^2 + 2y^2 - 2xy}{3}$$

$$= \frac{2}{3}(x^2 + y^2 - xy)$$

$$\geq 0 \qquad \text{(since } x^2 + y^2 \geq xy \text{ from i)}$$

$$x^2 + y^2 \geq 3z^2$$

(b) (i)

(ii) Since this shape is a rhombus, the vertex angles are bisected by the diagonals.

 \therefore arg (z+w) is the average of $\frac{4\pi}{9}$ and $\frac{7\pi}{9}$

$$\arg(z+w) = \frac{1}{2} \left(\frac{4\pi}{9} + \frac{7\pi}{9} \right)$$
$$= \frac{11\pi}{18}$$

OR
$$\arg(z+w) = \frac{4\pi}{9} + \frac{1}{2} \left(\frac{7\pi}{9} - \frac{4\pi}{9} \right)$$

(iii) Since diagonals bisect each other at right angles, $\frac{1}{2}|z+w| = 2\cos 30^{\circ}$ $|z+w| = 2\sqrt{3}$

(c) (i)
$$\int_{0}^{\frac{\pi}{2}} \frac{dx}{2 + \sin x} = \int_{0}^{1} \frac{\frac{2dt}{1+t^{2}}}{2 + \frac{2t}{1+t^{2}}} \times \frac{1+t^{2}}{1+t^{2}}$$

$$= \int_{0}^{1} \frac{2dt}{2(1+t^{2}) + 2t}$$

$$= \int_{0}^{1} \frac{dt}{t^{2} + t + 1}$$

$$= \int_{0}^{1} \frac{dt}{(t + \frac{1}{2})^{2} + \frac{3}{4}}$$

$$= \frac{2}{\sqrt{3}} \left[\tan^{-1} \frac{2(t + \frac{1}{2})}{\sqrt{3}} \right]_{0}^{1}$$

$$= \frac{2}{\sqrt{3}} \left(\tan^{-1} \sqrt{3} - \tan^{-1} \frac{1}{\sqrt{3}} \right)$$

$$= \frac{2}{\sqrt{3}} \left(\frac{\pi}{3} - \frac{\pi}{6} \right)$$

$$= \frac{\pi}{3\sqrt{3}}$$

Let
$$t = \tan \frac{x}{2}$$
 $x = 0$, $t = 0$

$$\tan^{-1} t = \frac{x}{2}$$
 $x = 2 \tan^{-1} t$

$$dx = \frac{2}{1+t^2} dt$$

(ii)
$$\int_{0}^{2a} f(x)dx = \int_{0}^{a} f(x)dx + \int_{a}^{2a} f(x)dx$$
 Let $u = 2a - x$ (in 2nd integral)
$$(\text{so } x = u - 2a)$$

$$= \int_{0}^{a} f(x)dx + \int_{a}^{0} f(2a - u) \cdot (-du)$$

$$x = 0, \quad u = a$$

$$x = 2a, \quad u = 0$$

$$= \int_{0}^{a} f(x)dx + \int_{0}^{a} f(2a - u)du$$

$$= \int_{0}^{a} f(x)dx + \int_{0}^{a} f(2a - x)dx$$
 (since choice of var does not affect def int)
$$= \int_{0}^{a} \left[f(x) + f(2a - x) \right] dx$$

(iii)
$$\int_0^{\pi} \frac{x}{2+\sin x} dx = \int_0^{\frac{\pi}{2}} \left(\frac{x}{2+\sin x} + \frac{\pi - x}{2+\sin(\pi - x)} \right) dx \qquad \text{(by part ii)}$$

$$= \int_0^{\frac{\pi}{2}} \left(\frac{x}{2+\sin x} + \frac{\pi}{2+\sin x} - \frac{x}{2+\sin x} \right) dx$$

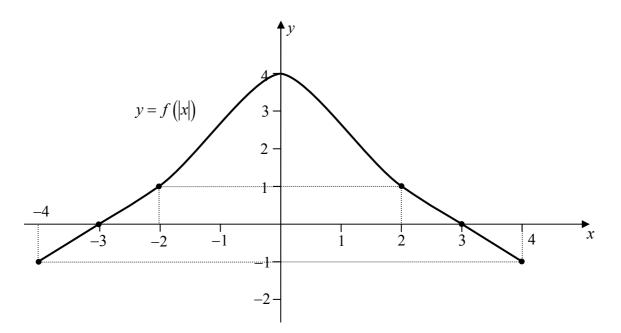

$$= \pi \int_0^{\frac{\pi}{2}} \frac{dx}{2+\sin x}$$

$$= \pi \cdot \frac{\pi}{3\sqrt{3}} \qquad \text{(by part i)}$$

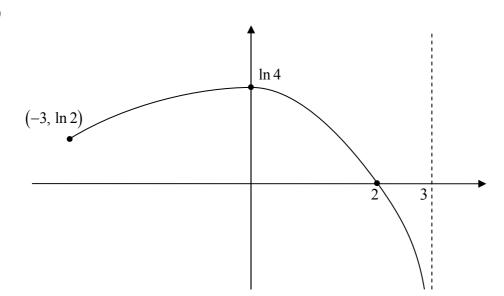

$$= \frac{\pi^2}{3\sqrt{3}}$$

Question 14

$$xy = c^{2}$$

$$x \cdot \frac{dy}{dx} + y \cdot 1 = 0$$

$$\frac{dy}{dx} = -\frac{y}{x}$$
at $P\left(ct, \frac{c}{t}\right)$, $m_{T} = -\frac{\frac{c}{t}}{ct}$

$$= -\frac{1}{t^{2}}$$
Tangent: $y - \frac{c}{t} = -\frac{1}{t^{2}}(x - ct)$

$$t^{2}y - ct = -x + ct$$

$$x + t^{2}y = 2ct$$

(ii)
$$OT$$
 has gradient $\frac{y_1}{x_1}$, and $OT \perp PT$.

So
$$m_{OT} \cdot m_{PT} = -1$$

$$\frac{y_1}{x_1} \cdot \left(-\frac{1}{t^2} \right) = -1$$

$$y_1 = t^2 x_1$$

(iii) Since T satisfies equation of tangent:

$$x_{1} + t^{2}y_{1} = 2ct$$

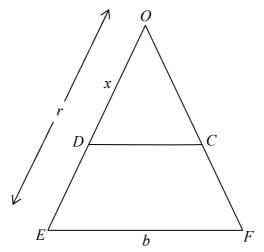

$$x_{1} + \frac{y_{1}}{x_{1}} \cdot y_{1} = 2c \cdot \sqrt{\frac{y_{1}}{x_{1}}} \qquad \text{(from part ii)}$$

$$(\times x_{1}) \quad x_{1}^{2} + y_{1}^{2} = 2cx_{1}\sqrt{\frac{y_{1}}{x_{1}}}$$

$$= 2c\sqrt{x_{1}y_{1}}$$

$$(\text{squaring}) \quad (x_{1}^{2} + y_{1}^{2})^{2} = 4c^{2}x_{1}y_{1}$$
ie. locus of T is $(x^{2} + y^{2})^{2} = 4c^{2}xy$

(c) (i) By similar triangles OCD and OFE in the base:

$$\frac{DC}{EF} = \frac{OD}{OE}$$

$$\frac{DC}{b} = \frac{x}{r}$$

$$DC = \frac{bx}{r}$$
 (base of rectangular slice)

Height of slice
$$h = y$$

= $r^2 - x^2$

Thickness of Slice = δx

$$\therefore \text{ Volume of slice } \delta V = \frac{bx}{r} \cdot \left(r^2 - x^2\right) \cdot \delta x$$

(ii) Volume
$$V = \lim_{\delta x \to 0} \sum_{x=0}^{r} \frac{bx}{r} (r^2 - x^2) \delta x$$

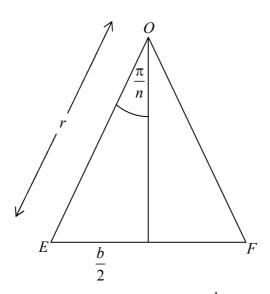

$$= \frac{b}{r} \int_{0}^{r} (r^2 x - x^3) dx$$

$$= \frac{b}{4r} \left[2r^2 x^2 - x^4 \right]_{0}^{r}$$

$$= \frac{b}{4r} (2r^4 - r^4)$$

$$= \frac{br^3}{4}$$

(iii)

$$\sin\frac{\pi}{n} = \frac{b}{2r}$$
$$b = 2r\sin\frac{\pi}{n}$$

$$V_n = \frac{1}{4} \cdot b \cdot r^3$$

$$= n \cdot \frac{1}{4} \cdot 2r \sin \frac{\pi}{n} \cdot r^3$$

$$= \frac{1}{2} r^4 n \sin \frac{\pi}{n}$$

(iv) As
$$n \to \infty$$
, $\frac{\pi}{n} \to 0$, so $\sin \frac{\pi}{n} \to \frac{\pi}{n}$
So $\lim_{n \to \infty} V_n = \frac{1}{2} r^4 n \cdot \frac{\pi}{n}$
 $= \frac{1}{2} \pi r^4$

Question 15

(a) Let
$$P(x) = 2x^3 - 5x + 1$$

 $P\left(-\frac{x}{2}\right) = 0$ has roots -2α , -2β , -2γ
 $2\left(-\frac{x}{2}\right)^3 - 5\left(-\frac{x}{2}\right) + 1 = 0$
 $-\frac{x^3}{4} + \frac{5x}{2} + 1 = 0$
 $x^3 - 10x - 4 = 0$

(b) (i)
$$z^{n} + z^{-n} = (\cos \theta + i \sin \theta)^{n} + (\cos \theta + i \sin \theta)^{-n}$$
$$= \cos n\theta + i \sin n\theta + \cos(-n\theta) + i \sin(-n\theta)$$
$$= \cos n\theta + i \sin n\theta + \cos n\theta - i \sin n\theta$$
$$= 2 \cos n\theta$$

(ii)
$$\left(z + \frac{1}{z}\right)^3 = z^3 + 3z + \frac{3}{z} + \frac{1}{z^3}$$

 $z^3 + \frac{1}{z^3} = \left(z + \frac{1}{z}\right)^3 - 3\left(z + \frac{1}{z}\right)$
 $= u^3 - 3u$

(iii) IF you HAD to show this result:

$$\left(z + \frac{1}{z}\right)^5 = z^5 + 5z^3 + 10z + \frac{10}{z} + \frac{5}{z^3} + \frac{1}{z^5}$$

$$z^5 + \frac{1}{z^5} = \left(z + \frac{1}{z}\right)^5 - 5\left(z^3 + \frac{1}{z^3}\right) - 10\left(z + \frac{1}{z}\right)$$

$$= u^5 - 5\left(u^3 - 3u\right) - 10u$$

$$= u^5 - 5u^3 + 5u$$

$$1 + \cos 10\theta = 1 + (2\cos^2 5\theta - 1)$$

$$= 2\cos^2 5\theta$$

$$= \frac{1}{2}(2\cos 5\theta)^2$$

$$= \frac{1}{2}(z^5 + z^{-5})^2 \qquad \text{(from part i)}$$

$$= \frac{1}{2}(u^5 - 5u^3 + 5u)^2 \quad \text{(given)}$$

$$= \frac{1}{2}[(2\cos \theta)^5 - 5(2\cos \theta)^3 + 5(2\cos \theta)]^2$$

$$= \frac{1}{2}(32\cos^5 \theta - 40\cos^3 \theta + 10\cos \theta)^2$$

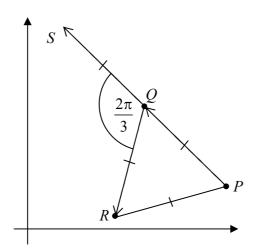

$$= 2(16\cos^5 \theta - 20\cos^3 \theta + 5\cos \theta)^2$$

(i)
$$\overrightarrow{QP} = \overrightarrow{QR} \cdot \operatorname{cis} \frac{\pi}{3}$$
 (since angle in equilateral triangle is $\frac{\pi}{3}$)
$$p - q = (r - q) \cdot \operatorname{cis} \frac{\pi}{3}$$

$$r - q = (p - q) \cdot \operatorname{cis} \left(-\frac{\pi}{3}\right)$$
 (to divide by a complex number, multiply by its conjugate)
$$r - q = (q - p) \cdot \operatorname{cis} \left(\pi - \frac{\pi}{3}\right)$$
 (to multiply by -1 , add π to the argument)
$$r - q = \operatorname{cis} \frac{2\pi}{3}(q - p)$$

OR

(c)

$$\angle SQR = \frac{2\pi}{3}$$
 (exterior angle of triangle = opposite interior angle)
 $r - q = \overline{QR}$
 $= \operatorname{cis} \frac{2\pi}{3} \cdot \overline{QS}$ (anticlockwise rotation by $\frac{2\pi}{3}$)
 $= \operatorname{cis} \frac{2\pi}{3} \cdot \overline{PQ}$
 $= \operatorname{cis} \frac{2\pi}{3} (q - p)$

(ii)
$$r-q = \left(\cos\frac{2\pi}{3} + i\sin\frac{2\pi}{3}\right)(q-p)$$
$$= \left(-\frac{1}{2} + i\frac{\sqrt{3}}{2}\right)(q-p)$$
$$2r-2q = \left(-1 + i\sqrt{3}\right)(q-p)$$
$$2r-2q = -q + p + iq\sqrt{3} - ip\sqrt{3}$$
$$2r = (p+q) + i\sqrt{3}(q-p)$$

(d) (i) PB subtends equal angles at N and L on the same side of PB.

OR

$$\angle BLP = \angle BNP$$
 (given)

:. BLNP is cyclic (converse of angles in same segment [or angles standing on same arc])

(ii)

```
NOTE: You may NOT say \angle BNL = \angle MNA (vertically opposite)

OR

\angle MNP = \angle PBL (ext angle of cyclic quad = opposite interior angle)

as these assume that LNM is a straight line,

WHICH IS WHAT YOU ARE TRYING TO PROVE.
```

```
\angle PMA = \angle PNA = 90^{\circ} (given)

\therefore PNAM is cyclic (exterior angle of cyclic quad equals opposite interior angle)

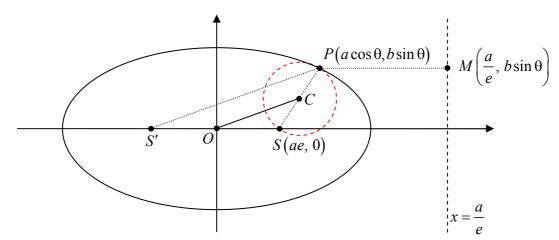

\angle MNP = \angle MAP (both angles stand on chord PM of cyclic quad PNAM)

= \angle PBC (exterior angle of cyclic quad APBC = \text{opposite interior angle})
```

 \therefore $\angle MNP$ is the exterior angle of cyclic quad BLNP (it equals the opposite interior angle) ie. LNM is straight (ie. L, M and N are collinear)

Question 16

(a) (i)

Centre:
$$C\left(\frac{ae+a\cos\theta}{2}, \frac{b\sin\theta}{2}\right) = C\left(\frac{a(e+\cos\theta)}{2}, \frac{b\sin\theta}{2}\right)$$

Diameter:
$$PS = ePM$$

$$= e \left(\frac{a}{e} - a \cos \theta \right)$$
$$= a \left(1 - e \cos \theta \right)$$

$$\therefore \text{ radius} = \frac{a}{2} (1 - e \cos \theta)$$

(ii) [The sneaky way]

Since $OS = \frac{1}{2}S'S$, $CS = \frac{1}{2}PS$ and $\angle OSC = \angle S'SC$, then $\triangle OSC$ and $\triangle S'SP$ are similar

$$\therefore OC = \frac{1}{2}PS'$$

But PS + PS' = 2a (sum of focal lengths = length of major axis)

$$\therefore CS + CO = a$$

$$\frac{a}{2}(1 - e\cos\theta) + OC = a$$

$$OC = a - \frac{a}{2} + \frac{a}{2}e\cos\theta$$

$$OC = \frac{a}{2} \left(1 + e \cos \theta \right)$$

[The hard slog]

$$OC^{2} = \frac{a^{2}}{4} (e + \cos \theta)^{2} + \frac{b^{2}}{4} \sin^{2} \theta$$

$$= \frac{1}{4} (a^{2} e^{2} + 2a^{2} e \cos \theta + a^{2} \cos^{2} \theta + b^{2} \sin^{2} \theta)$$

$$= \frac{1}{4} (a^{2} e^{2} + 2a^{2} e \cos \theta + a^{2} \cos^{2} \theta + a^{2} (1 - e^{2}) \sin^{2} \theta)$$

$$= \frac{a^{2}}{4} (e^{2} [1 - \sin^{2} \theta] + 2e \cos \theta + [\cos^{2} \theta + \sin^{2} \theta])$$

$$= \frac{a^2}{4} \left(e^2 \cos^2 \theta + 2e \cos \theta + 1 \right)$$
$$= \frac{a^2}{4} \left(e \cos \theta + 1 \right)^2$$

Since e < 1 for ellipse and $|\cos \theta| \le 1$ then $|e \cos \theta| < 1$ So $1 + e \cos \theta > 0$

$$\therefore OC = \frac{a}{2} (e \cos \theta + 1)$$

(b) (i)
$$P\left(-\frac{3}{2}\right) = 4\left(-\frac{3}{2}\right)^3 + 10\left(-\frac{3}{2}\right)^2 + 8\left(-\frac{3}{2}\right) + 3$$

= $-\frac{27}{2} + \frac{45}{2} - 12 + 3$
= 0

 \therefore P(x) is divisible by (2x+3)

(ii) Let zeros be
$$-\frac{3}{2}$$
, α , β

Sum: $-\frac{3}{2} + \alpha + \beta = -\frac{5}{2}$

$$\alpha + \beta = -1$$

Product: $-\frac{3}{2}\alpha\beta = -\frac{3}{4}$

$$\alpha\beta = \frac{1}{2}$$

 \therefore A polynomial with zeros α and β is $x^2 + x + \frac{1}{2}$.

But to get equal leading coefficients: $P(x) = (2x+3)(2x^2+2x+1)$

[Alternatively: divide]

(c) In case you had to prove the given result:

$$\tan\left(\tan^{-1} x + \tan^{-1} y\right) = \frac{\tan\left(\tan^{-1} x\right) + \tan\left(\tan^{-1} y\right)}{1 - \tan\left(\tan^{-1} x\right) \cdot \tan\left(\tan^{-1} y\right)}$$

$$=\frac{x+y}{1-xy}$$

$$\tan^{-1} x + \tan^{-1} y = \tan^{-1} \frac{x+y}{1-xy}$$

The Induction Proof:

RTP
$$\tan^{-1} \frac{1}{2 \times 1^{2}} + \tan^{-1} \frac{1}{2 \times 2^{2}} + \tan^{-1} \frac{1}{2 \times 3^{2}} + ... + \tan^{-1} \frac{1}{2n^{2}} = \frac{\pi}{4} - \tan^{-1} \frac{1}{2n+1}$$

Test $n = 1$:

LHS = $\tan^{-1} \frac{1}{2}$

RHS = $\frac{\pi}{4} - \tan^{-1} \frac{1}{3}$

LHS - RHS = $\tan^{-1} \frac{1}{2} + \tan^{-1} \frac{1}{3} - \frac{\pi}{4}$

= $\tan^{-1} \frac{\frac{1}{2} + \frac{1}{3}}{1 - \frac{1}{2} \cdot \frac{1}{3}} - \frac{\pi}{4}$ (using given rule)

= $\tan^{-1} 1 - \frac{\pi}{4}$

= $\frac{\pi}{4} - \frac{\pi}{4}$

= 0

LHS = RHS

 \therefore true for $n = 1$

Assume true for n = k:

ie.
$$\tan^{-1}\frac{1}{2\times 1^2} + \tan^{-1}\frac{1}{2\times 2^2} + \tan^{-1}\frac{1}{2\times 3^2} + \dots + \tan^{-1}\frac{1}{2k^2} = \frac{\pi}{4} - \tan^{-1}\frac{1}{2k+1}$$

Prove true for n = k + 1:

ie. RTP
$$\tan^{-1}\frac{1}{2\times 1^2} + \tan^{-1}\frac{1}{2\times 2^2} + \tan^{-1}\frac{1}{2\times 3^2} + ... + \tan^{-1}\frac{1}{2k^2} + \tan^{-1}\frac{1}{2(k+1)^2} = \frac{\pi}{4} - \tan^{-1}\frac{1}{2k+3}$$

LHS-RHS =
$$\left(\frac{\pi}{4} - \tan^{-1}\frac{1}{2k+1}\right) + \tan^{-1}\frac{1}{2(k+1)^2} - \left(\frac{\pi}{4} - \tan^{-1}\frac{1}{2k+3}\right)$$
 (by assumption)
= $\tan^{-1}\frac{1}{2(k+1)^2} + \tan^{-1}\frac{1}{2k+3} - \tan^{-1}\frac{1}{2k+1}$
= $\tan^{-1}\frac{\frac{1}{2(k+1)^2} + \frac{1}{2k+3}}{1 - \frac{1}{2(k+1)^2} \cdot \frac{1}{2k+3}} \times \frac{2(k+1)^2(2k+3)}{2(k+1)^2(2k+3)} - \tan^{-1}\frac{1}{2k+1}$
= $\tan^{-1}\frac{(2k+3) + 2(k+1)^2}{2(k+3) - 1} - \tan^{-1}\frac{1}{2k+1}$
= $\tan^{-1}\frac{2k^2 + 6k + 5}{4k^3 + 14k^2 + 16k + 5} - \tan^{-1}\frac{1}{2k+1}$
= $\tan^{-1}\frac{2k^2 + 6k + 5}{(2k+1)(2k^2 + 6k + 5)} - \tan^{-1}\frac{1}{2k+1}$
= $\tan^{-1}\frac{1}{2k+1} - \tan^{-1}\frac{1}{2k+1}$
= 0
LHS = RHS

Using the fact that $tan^{-1}(-x) = -tan^{-1}x$:

LHS =
$$\frac{\pi}{4} - \tan^{-1} \frac{1}{2k+1} + \tan^{-1} \frac{1}{2(k+1)^2}$$

= $\frac{\pi}{4} - \left(\tan^{-1} \frac{1}{2k+1} - \tan^{-1} \frac{1}{2(k+1)^2}\right)$
= $\frac{\pi}{4} - \tan^{-1} \frac{\frac{1}{2k+1} - \frac{1}{2(k+1)^2}}{1 + \frac{1}{2k+1} \cdot \frac{1}{2(k+1)^2}} \times \frac{2(2k+1)(k+1)^2}{2(2k+1)(k+1)^2}$
= $\frac{\pi}{4} - \tan^{-1} \frac{2(k+1)^2 - (2k+1)}{2(2k+1)(k+1)^2 + 1}$
= $\frac{\pi}{4} - \tan^{-1} \frac{2k^2 + 2k + 1}{4k^3 + 10k^2 + 8k + 3}$
= $\frac{\pi}{4} - \tan^{-1} \frac{1}{2k+3}$ (by part b)
= RHS

- \therefore true for n = k + 1 when true for n = k
- \therefore by Mathematical Induction, true for all positive integers n.

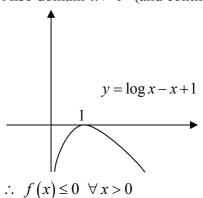

(d) (i)
$$f(x) = \log x - x + 1$$
$$f'(x) = \frac{1}{x} - 1$$
$$= \frac{1 - x}{x}$$

 \therefore stationary point at x = 1

$$f''(x) = -\frac{1}{x^2} < 0 \ \forall x$$

 \therefore minimum turning point at (1,0)

Also domain x > 0 (and continuous for all x in the domain).

(ii)
$$\sum_{r=1}^{n} \log(np_r) \le \sum_{r=1}^{n} (np_r - 1) \qquad \text{(from part i - } \log x \le x - 1 \quad \forall x > 0\text{)}$$
$$= \sum_{r=1}^{n} np_r - \sum_{r=1}^{n} 1$$

$$\sum_{r=1}^{n} \log(np_r) \le \sum_{r=1}^{n} np_r - n$$

(iii) Continuing from part ii:

$$\sum_{r=1}^{n} \log n p_r \le n \sum_{r=1}^{n} p_r - n \quad \text{(since } n \text{ is a constant)}$$

$$= n \cdot 1 - n$$

$$= n \cdot \sum_{r=1}^{n} \log n p_r \le 0$$

(iv) Continuing from part iii:

$$\begin{split} \log np_1 + \log np_2 + \dots + \log np_n &\leq 0 \\ \log \left(np_1 \cdot np_2 \cdot \dots \cdot np_n \right) &\leq 0 \\ \log \left(n^n \cdot p_1 p_2 \dots p_n \right) &\leq 0 \\ n^n \cdot p_1 p_2 \dots p_n &\leq 1 \end{split}$$

Also, since $p_1, p_2, ..., p_n$ and n are all positive, then $n^n \cdot p_1 p_2 ... p_n > 0$ $\therefore 0 < n^n \cdot p_1 p_2 \dots p_n \le 1$
